The book is divided into three parts. Part one has chapters that introduce data analysis and SPSS. Part two contains eight chapters on descriptive statistics that begin with frequency tables and go through multiple regression, and part three includes six chapters on inferential statistics. Part one, Getting Started, begins by answering some questions most students have right at the start: questions like why study data analysis and how much math and computer knowledge is required. Essential concepts from research methods relevant for data analysis are also explained. Part two, Descriptive Statistics, answers questions about your data, demonstrates procedures to use when the analyst is only concerned with describing the cases for which he or she actually has data. Statistics summarizing single variables, univariate statistics, are presented first, and then statistics summarizing relationships between variables, multivariate statistics. Frequency tables, measures of central tendency, measures of dispersion, crosstabs, measures of association, subgroup means, and regression are all covered, as are bar charts, pie charts, histograms, and clustered bar charts. Part three, Inferential Statistics, answers questions about populations, explains procedures which allow the analyst to draw conclusions about the population from which his or her sample of cases was randomly selected. It begins with a simple chapter on the statistical theory behind inferential statistics. A four-step approach to hypothesis testing is introduced in the next chapter and demonstrated with one sample t test hypotheses. The remaining chapters present different types of hypothesis tests including paired samples, independent samples, one and two way ANOVA, and chi square provided by publisher.
